(54) Title: **METHOD AND APPARATUS FOR SELECTIVE DATA RECEPTION**

(57) Abstract: A terminal 13 for selectively receiving broadcast data in a transport stream 7 over a first network, the broadcast data including a series of bursts of associated data packets (B1), comprises a controller 16 and a receiver 19. The controller 16 is configured to extract information identifying a group of data packets from the data packets within a first burst, e.g. Packet Identifier (PID) PID1, PID2, calculate a burst length and burst interval for the series on the basis of the times at which data packets are received by the receiver and to calculate one or more instances of time t_i at which one or more subsequent bursts in the series will be received based on the calculated burst length t_{Bj} and/or burst interval t_{1j} . The receiver 19 is operated to selectively receiving the transport stream 7, e.g. by switching the receiver 19 between its on and off states, the receiver 19 being switched on at time t_i for a period equal to the burst length in order to receive subsequent data bursts in the series. The terminal 13 may be further configured to enable mobile telephone communication via a second network.

For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.
